Midwest health care tech company reaches key growth benchmark

WebCareHealth continues quest to serve providers and patients, deliver precision medicine

January 22, 2019 (ANKENY) – The number of enrolled and active patients using CoagMgr has just surpassed 4,000. The benchmark is not only significant for WebCareHealth (WCH), developer of CoagMgr, but is a sign of health and hope for the estimated 4 million patients in the United States taking anticoagulation medication. Internal studies show patients monitoring such medication at home with CoagMgr have a 144 percent increase in positive results than with traditional methods of care.

“It’s immensely inspiring to know that even more people managing their anticoagulation meds could see improved health with CoagMgr,” said Teresa Sieck, WCH President. “As the population of patients using our solution grows we continue to see positive results. Patients and care providers are using it to collaborate and identify the precise treatment for each person. At the same time providers can also track the health of this patient population to achieve results on a large scale.”

CoagMgr is an at-home monitoring system offering a streamlined approach to provider-driven patient care management of INR (International Normalized Ratio) testing. INR testing is required for patients on certain anticoagulation medication. Patients take anticoagulation therapies for chronic conditions such as atrial fibrillation, mechanical heart valves, hypercoagulable states, deep vein thrombosis and pulmonary embolism.

With CoagMgr, patients can test their INR levels at home or on-the-go using a handheld testing device and report results using WebCareHealth’s patent-pending INR software. The results are reported by phone, online or via the CoagMgr mobile app and are instantly accessible by a patient’s health care provider. The web-based application is easy to use, provides educational resources, tracks patient results and compliance, and offers providers notifications and automated billing reports.

Twenty health care provider systems have implemented CoagMgr helping WCH to onboard the 4,000th patient. WCH’s studies have shown using CoagMgr helps patients stay within their therapeutic INR range resulting in a reduction of adverse events related to anticoagulation management and lowering the cost of care by more than 15 percent.

###

About WebCareHealth: Founded in 2014 WCH develops innovative cloud-based software solutions that enable health care providers to remotely monitor the health of patients managing chronic illnesses including heart failure and diabetes. More than 4,000 such patients receive close monitoring and care through WCH’s partnership with 20 healthcare systems representing 78 facilities across the U.S.
